CUSTOMER SUPPORT SERVICES

At XCL, we always believe in going the Extra Mile for our customers and ensure that they don't travel that extra mile to reach us! We are available 24 x 7 x 365 to attend to your every query in the way of your preference!

RESPONSIBILITIES OF THE RESTAURANT

1. The restaurant will need to issue the Purchase / Work order along with the advance payment and sign the Software License Agreement (SLA) before the commencement of the implementation period.
2. The restaurant would need to provide all required input data for initial set-up and complete the pre-requisites, before the commencement of the implementation period.
3. All hardware and cabling installation will have to be installed at the restaurant prior to the implementation of software systems.
4. The user departments of the restaurant are responsible for creating master files (by entering all data) and back - up records of all master and data-files.
5. Communication protocols of third party products for which interfaces have to be developed by XCL should be made available at least three weeks in advance to facilitate development of programs and get the same Quality Assured.

Work Implementation Methodology

Proposed System Platform: -

Visual Basic 6.0 /.net(Front End)

Visual Basic 6.0 is the quickest and easiest way to create applications for the Microsoft Windows Operating System. It contains a built-in interpreter with the extensive tools for sensing the debugging code errors. It also contains a built in compiler that makes compiling both quick and easy. The most significant component of visual basic is the built in integrated development environment (IDE), with this we can design screen presentations and menus built in controls and tables, and the IDE actually writes the codes for carrying out the design constructions.

Using visual basic we can create powerful-featured application that exploits the key feature of MS-windows, including multiple document interface (MDI), object linking and embedding (OLE), dynamic data exchange (DDE), graphics and more, visual basic can be extended by adding custom controls and by calling procedures in dynamic link libraries (DLL). Our finished application is a true EXE file that uses a run time DLL, we can freely distribute.

SQL 2000 SERVER /Acess(Back End)

Structure query language was created to be a universal programming language to request specific data from the database. RDBMS provides centralized storage area for data and provides the services to manage shared; concurrent access to that data's server 2000 also supports the concept of standby server. In this scenario, two physical servers each have a duplicate copy of your database. The database must be sync via routing database transaction log backups. In the event of failure, the standby server will be brought online as the primary server. So the SQL 2000 is capable of providing both the availability and reliability that is required within the Enterprise.
